-!- SUBUNIT: THE VIRTON OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA (BY SIMILARITY).

Gen. Virol. 82:1291-1297(2001).

-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY A LIPOPMOTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN H AND GLYCOPROTEIN E. THE NUCLECCAPSID IS A COMPLEX OF PROTEIN C AND MRNA (BY SIMILARITY).

"Hepatitis C Virus.";
Submitted (JUL-2000) to the EMBL/GenBank/DDBJ databases.
-I-SUBUNIT: THE VIRION OF THIS VIROS IS A NUCLECCAPSID COVERED BY A LIPOPROTEIN ENVELOPE CONSIGNS OF TWO PROTEINS:
PROTEIN M AND GRYCOPROTEIN E. THE NUCLECCAPSID IS A COMPLEX OF PROTEIN C AND MARA (PY SIMILARITY).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                          SUMMARIES

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed,

and is derived by analysis of the total score distribution.

a

```
The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both sescential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and Niver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-7 variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   180

```
The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-7 variant.

```
The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and Niver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease:inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-1 variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SerProLysGlyProValThrGlnMetTyrThrAsnValAspLysAspLeuValGlyTrp 100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GlnAlaProGlnGlySerArgSerLeuThrProCysThrCysGlySerSerAspLeuTyr 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-1 variant.
                                                                                                                                                                                                                             540

                                                                                                                                                                                                                           The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the Polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-l variant.

The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver diallure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this

fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-1 variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               101 GlnalaProGlnGlySerArgSerLeuThrProCysThrCysGlySerSerAspLeuTyr 120 [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [1111] [

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is the coding sequence for a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis. Ilver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and
161 ProAlaClyHisAlaValGlyIlcPheArgAlaAlaValSerThrArgGlyValAlaLys 180
                   Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a nucleic acid construct encoding a chimeric Hepatitis C virus (HCV)-pestivirus genome. The construct comprises a pestivirus genome where a Npro pestivirus protease gene is replaced with a gene encoding a functional HCV NS3 protease. Furthermore, each junction site recognised by the Npro protease is replaced with a junction site recognised by the HCV NS3 protease. The construct is useful for screening compounds that inhibit HCV in vivo by inhibiting HCV protease, where screening may be in cell culture or in an animal model. The present sequence is a chimmeric clone of BVDV (bovine viral diarrhea virus)/HCV NS3-wt, which was used to illustrate the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          81
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     22 AlaGlnGlnThrArgGlyGluGlnGlyThrGlnLysThrSerHisThrGlyArgAspLys 41
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NS4A-NS3 complex computating a central hydrophobic domain of native NCV NS4A-NS3 complex complex and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A serine protease domain, where the hydrophobic domain of native HCV NS4A serine protease domain, where the hydrophobic domain of native HCV NS4A serine protease domain. The present sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NNR spectroscopy. They can also be used for detecting inhibitors of the protease activity and the Arpase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the noncovalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SerIleAsnGlyValLeuTrpThrValTyrHisGlyAlaGlyThrArgThrIleAlaSer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  42 AsnGlnValGluGlyGluValGlnIleValSerThrAlaThrGlnThrPheLeuAlaThr

The present sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NHR spectroscopy. They can also be used for detecting inhibitors of the protease activity and the APPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the noncovalent protease-peptide complexes previously available.

                                                                                                                                                                                                            NS4A-NG3 complex comprising a central hydrophobic domain of native HCV NS4A-PD51cde, a linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, when the helicase activity and the ATPASE activity of NS3. The covalent was the helicase activity of NS3. The covalent was the model of the ATPASE activity of NS3. The covalent was the model of the ATPASE activity of NS3. The covalent was the model of the ATPASE activity of NS3. The covalent was the model of the ATPASE activity of NS3. The covalent was the model of the ATPASE activity of NS3. The covalent was the atpase activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a covalent hepatitis C virus (HCV) NS4ANS3 complex comprising a central hydrophobic domain of native HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence encodes an example of the above complex. The covalent NS4A NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the noncovalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             HCV; hepatitis C virus; single chain recombinant complex; linker; NS3 protease; NS4A cofactor; NS4A-NS3 complex; serine protease; hydrophobic domain; covalent complex; detection; inhibitor; ss.

NS4A peptide, a linker, and an HCV NS3 serinc protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPASE activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the noncovalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                         102 AlaProGlnGlySerArgSerLeuThrProCysThrCysGlySerSerAspLeuTyrLeu

The present invention describes a covalent hepatitis C virus (HCV) NSAA-NS3 complex comprising a central hydrophobic domain of native HCV NSAA peptide, a linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NSAA peptide is tethered by the linker to the amino terminus of the HCV NSAA peptide is tethered by the linker to the amino terminus of the HCV NS3A protease domain. The present sequence encodes an example of the above complex. The covalent NSAA-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NNR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPASE activity of NS3. The covalent NSAA-NS3 complexes are more soluble, stable and active than the noncovalent protease-peptide complexes previously available.

Sequence 23, Application US/09965594

Sequence 23, Application US/09965594

Patent No. US20020016642A1

GENERAL INFORMATION:
APPLICANT: Wittekind, Michael
APPLICANT: Weinheamer, Steven
APPLICANT: Canage, Yaquen
TITLE OF INVENTION: Modified Forms of Hepatitis C NS3 Protease for
TITLE OF INVENTION: Modified Forms of Hepatitis C NS3 Protease for
TITLE OF INVENTION: Modified Forms of Protease: Inhibitor Complexes
FILE REFERENCE: D8178equences
CURRENT APPLICATION NUMBER: US/09/965,594
CURRENT APPLICATION NUMBER: 60/115,271
PRIOR APPLICATION NUMBER: 60/115,271
PRIOR FILING DATE: 1999-01-08
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 23
LENTH: 594
                                                                                                                                                            Sequence 4, Appli

Sequence 15, Application US/09965594
Patent No. US20020106642a1
GENERAL INFORMATION:
APPLICANT: Withekind, Michael
APPLICANT: Weinhelmer, Steven
APPLICANT: Weinhelmer, Steven
APPLICANT: Zhang, Yaqun
APPLICANT: Zhang, Yaqun
TILLE OF INVENTION: Modified Forms of Repatitis C NS3 Protease for
TITLE OF INVENTION: Pacilitating Inhibitor Screening and Structural Studies
TITLE OF INVENTION: of Protease:Inhibitor Complexes
TITLE OF INVENTION: Of Protease:Inhibitor Complexes
TITLE PEPERENCE: DB1/Sequences
CURRENT APPLICATION NUMBER: US/09/965,594
CURRENT APPLICATION NUMBER: 60/115,271
PRIOR APPLICATION NUMBER: 60/115,271
                                                                                                                                                                                      240

Patent No. US20020106642a1
GENERAL INFORMATION:
APPLICANT: Witched, Michael
APPLICANT: Weinheimer, Steven
APPLICANT: Coldfach, Valentia
APPLICANT: APPLICATION: Modified Forms of Hepatitis C NS3 Frotease for
TITLE OF INVENTION: Pacilitating Inhibitor Screening and Structural Studies
TITLE OF INVENTION: of Protease:Inhibitor Complexes
FILE REFERENCE: DB17Sequences
CURRENT APPLICATION NUMBER: US/09/965,594
CURRENT-FILING DATE: 2001-09-27
